ting course Around the Sun after they were formed. The gravity of the Moon

keeps it in its orbit.

In our Solar System, the planets stay in their orbits because

there is no other force in the Solar System which can

stop them.

A satellite stays in orbit because the launch vehicle is enough to keep a

satellite on orbit for hundreds of years. A satellite maintains its orbit by balancing

two factors:

its velocity (the speed it takes to travel in a straight line) and the

gravity of the Sun.

The planets all formed from this spinning disk-shaped cloud, and continued this rotating course around the Sun after they were formed.

The gravity of the Sun keeps the planets in their orbits. They stay in their

orbits because there is no other force in the Solar System which can

stop them.
