Q: What are decimal odds?

A: Decimal odds are a simple and standardized representation of the odds

of winning a bet, expressed as a single number. This number represents the number of dollars you will receive in winnings for every dollar

wagered. A number between 1 and 2 indicates a favorable bet and 2 represents a fair bet.

Q: How do I calculate decimal odds?

A: To calculate decimal odds, you need to understand the fractional probabilities. Transform the fractional probabilities to decimal probability using the formula  $\left\{\frac{\text{Partes inferiores}}{\text{Todos}}\right\}$ . Therefore, if the

favorite and non-favorite cases are 5 and 8, respectively, then divide

the favorite cases by the total ( $13-5=8$ ) to get a probability of 0.615 (61%)
